No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DB seq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The cDNA encodes a full length human neurotrophic factor receptor TRK-B. TRK-B is a receptor for brain-derived neurotrophic factor but it also binds neurotrophin-3 and -4/5. The cDNA be used to express the full length protein and to design primers for detection of the presence of TRI-B transcripts in cells. Antisense oligonucleotides can be used to inhibit the expressiong of TRK-B in neuroblastomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid encoding human neurotrophic factor receptor, TRK-B develop primers and antibodies for use in assays to determine aggressiveness of neuroblastoma tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        29-JUN-1995;

The methods and compositions of the invention are useful for treating or preventing neurodegenerative or neurodevelopmental disorders such as Alzheimer's disease (AD), Parkinson's disease (PD), Huntington's disease (HD), amyotrophic lateral sclerosis (ALS; Lou Gehrig's disease), diabetic peripheral neuropathy, the adverse complications of Down's syndrome (DS) and other types of peripheral neuropathy. Sequences of the invention are also used in gene therapy. The present sequence is human makes the syndrome are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating and/or preventing neurodegenerative and neurodevelopmental disorders such as Alzheimer's, Parkinson's and Huntington's diseases by altering the ratio of amount of full-length and truncated TrkB or TrkC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2002-698627/75

         The invention relates to a method for detecting a lung cancer-associated CC transcript in a cell from a patient, comprising contacting a biological CC sample from the patient with a polynucleotide that selectively hybridises CC increased or decreased expression in lung cancer samples. Lung cancer CC associated polynucleotides and polypeptides are used for identifying a CC compound that modulates a lung cancer-associated polypeptide, for CC inhibiting proliferation of a lung cancer-associated cell to treat lung CC cancer in a patient and for treating a mammal having lung cancer by CC administering a modulatory compound identified. The methods are useful CC for treating lung cancer, such as small cell lung cancer, or other benign or precancerous lesions, e.g. atelectasis, CC hypersensitivity pneumonitis, interstitial pulmonary disease, fibrosis, depressensitivity pneumonitis, interstitial pulmonary fibrosis, astuma and CC bronchiectasis. The genes, polynucleotides and polypeptides are useful CC compounds that modulate lung cancer, such as antibodies. Sequences of the analysis of the compounds that modulate lung cancer, such as antibodies. Sequences

Treating and/or preventing neurodegenerative or neuro-developmental disorders, such as Alzheimer's disease, Parkinson's disease and amyotrophic lateral sclerosis, using nucleic acids encoding TrkB and polypeptides.

Disclosure; Page 56-58; ; qqee English.

The invention relates to treating a neurodegenerative or neuroCC developmental disorder in a mammal. The method involves altering the
CC ratio of the amount of full length TrkB polypeptide to the amount of
CC amount of full length TrkC polypeptide to the amount of truncated TrkB polypeptides in a neuron or by altering the ratio of the
CC amount of full length TrkC polypeptide to the amount of truncated TrkC
CD polypeptides in a neuron. The methods and compositions of the present
CC invention are useful for treating and/or preventing a neurodegenerative
CC or neuro-developmental disorder, such as Alzheimer's disease, ParkInson's
CC disease, Huntington's disease, amyotrophic lateral sclerosis (Lou
CC dehrig's disease), the adverse neurologic complications of Down syndrome,
CC diabetic peripheral neuropathy and other types of peripheral neuropathy,
CC and is associated with an injury to the central or peripheral and/or
CC system resulting from stroke, cerebral ischaemia, or chemical and/or
CC physical trauma. The present sequence represents a human TrkB polypeptide
CC encoding DNA (GenBank Accession No. NM_006180)

```

The invention relates to a method of identifying a compound useful in the CC treatment of AIDS (acquired immunodeficiency syndrome) or an HIV (human cc) immunodeficiency virus)-related disorder. The invention involves assaying the ability of a test compound to modulate the activity or expression of CC (ADS of ADE40473) are differentially expressed in tissues relating to CC (AIDS or an HIV-related disorder compared to their expression in normal CC identified to modulate viral replication in a cell and to treat a patient CC with AIDS or an HIV-related disorder. The invention fire the dispression of related to modulate viral replication in a cell and to treat a patient CC with AIDS or an HIV-related disorder. The invention further discloses CC methods for the diagnostic evaluation and prognosis of various HIV-related disorders, and for the identification of individuals exhibiting a CC predisposition to such conditions. The modulatory compounds identified CC using the method of the invention may be small organic molecules, peptides, antibodies or antisense nucleic acid molecules. The methods of the invention are useful in diagnosing, preventing or treating AIDS or HIV-related disorders. The present sequence represents a human conjuncted which is differentially expressed in AIDS or HIV-related

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

CC whose expression is upregulated or downregulated in specific cancers or

cother diseases such as angiogenic or fibrotic disorders, and to methods

cc of determining the presence or absence of a pathological cell in a

cc patient by detecting a nucleic acid at least 80% identical to those of

cc invention or by detecting a polypeptide of the invention. The

cc invention also relates to expression vectors and host cells comprising a

cc nucleic acid of the invention; use of such antibodies for drug targeting;

cc and methods of screening for modulators of activity or expression of the

cc polypeptide and nucleic acids. The nucleic acids, polypeptides,

cc antibodies and methods are useful for diagnosing, prognosing and treating

cc cancer and other conditions such as psoriasis, ischaemia, heart disease,

cc atherosclerosis, inflammatory diseases, autoimmune diseases, retinal

cc neovascularistaion syndromes, scarring and uterine fibroids. They may

cc also be useful in wound healing and in contraception. The present

cc sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches 3707;

                                                                                                                         The invention relates to nucleic acids and proteins (ADN38683-ADN40064) whose expression is upregulated or downregulated in specific cancers or other diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a patient by detecting a nucleic acid at least 80% identical to those of the invention or by detecting a polypeptide of the invention. The invention also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a polypeptide of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the antibodies and nucleic acids. The nucleic acids, polypeptides, antibodies and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as psoriasts, ischaemia, heart disease, atherosclerosis, inflammatory disease, autommune diseases, retinal
                                                                         atneroscierosis, inflammatory diseases, autoimmune diseases, retineovascularistation syndromes, scarring and uterine fibroids. They also be useful in wound healing and in contraception. The present sequence represents a nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inflammatory disease; autoimmune disease; retinal neovascularistaion syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis; drug screening; drug targeting wound healing; contraception; cytostatic; cardiant; immunomoduli
